Dell EMC Unity XT Architecture

Dell EMC Unity XT All-Flash and Hybrid Flash arrays set new standards for storage with compelling simplicity, all-inclusive software, blazing speed, optimized efficiency, multi-cloud enablement – all in a modern NVMe-ready design – to meet the needs of resource-constrained IT professionals in large or small companies. Designed for performance, optimized for efficiency and built for hybrid cloud environments, these systems are the perfect fit for supporting demanding virtualized applications, deploying unified storage and addressing Remote-Office-Branch-Office requirements.

Unity XT also delivers true metro active-active capabilities with zero performance impact on the storage controllers or data path with Unity XT metro node. Metro configurations are the next step in a truly disaster resilient architecture, enabling business continuity – without intervention.

Dell EMC Unity XT Metro Node Overview

Enable automated business continuity with zero RPO and RTO with Unity XT metro node. True active-active synchronous replication over metro distances with multi-site dual access gives organizations full confidence that their data will always be available and accessible and there is no time associated with recovery. Metro node provides greater flexibility through multi-platform support, workload granularity and replication to any array. There is zero performance overhead, no duplicate capacity on the array and no additional software required on the host. The VM witness technology provides the ability to automatically initiate an instant site failover. Metro node supports local configurations for continuous application availability, data mobility to non-disruptively relocate workloads and enables storage technology refresh without application downtime.

Dell Technologies

Dell EMC Unity XT metro node
Active-active synchronous replication over metro distance

- Delivers Recovery Time Objective (RTO) and Recovery Point Objective (RPO) equal to "zero" time
- Systems are mirrored and data is fully accessible on both sites
- Mirroring is done per volume, allowing granularity per workload
- Provides ability to initiate automatic failover through VM witness technology
- Provides completely independent processing and uses no array or host cycles

- Local site failure causes all local volumes to go offline
- Remote volumes stay online with no downtime
- Connected hosts will not lose connectivity or see any downtime

Dell Technologies

- **Zero RPO and RTO** - Metro node is an active-active solution, which means it actively mirrors data across metro distance. Metro node provides a Recovery Point Objective (RPO) equal to zero, meaning there will be zero data loss. Metro node also provides a zero Recovery Time Objective (RTO), which means the time to recover is zero time or immediately.
- **Automatic Site Failover** - The witness virtual machine helps mitigate a site failure.
- **Active-Active Metro** – Metro node provides optimized data access from both sites for increased performance.
- **Avoid Degradation to Array Performance** - Metro node replication is built-in to the appliance without any array overhead increases.
- **No Additional Host Software** - Metro node is self-contained and does not require any software be deployed on the hosts or a host reboot.
- **Multi-Platform Support** - Metro node enables replication between different Dell EMC arrays.
- **Volume/LUN Level Granularity** - Metro node allows the replication of specific LUNs for application level granularity, significantly reducing TCO and improving flexibility by giving customers the choice of which workloads to replicate.
- **Non-disruptive Addition of Consistency Groups** - Metro node supports consistency group add/delete operations without disruption and provides operational flexibility with zero downtime.
