Overview

In this constantly changing world of increasing complexity and scale, the need for an easy-to-use intelligent storage system has only grown greater. Customers using new applications and solutions require dependable storage and are often tasked with the challenge of "doing more with less". The Dell Unity family addresses this challenge by packaging a powerful storage system into a cost and space-efficient profile. Some of Dell Unity's highlight features include:

- **Dual-Active Architecture** – Dell Unity uses both Storage Processors (SP) to serve host I/O and run data operations in an active/active manner to make efficient use of all available hardware resources and optimizing performance, cost, and density in customer data centers.

- **Truly Unified Offering** – Dell Unity delivers a full block and file unified environment in a single 2U enclosure. Use the same Pool to provision and host LUNs, Consistency Groups, NAS Servers, File Systems, and Virtual Volumes alike. The Unisphere management interface offers a consistent look and feel whether you are managing block resources, file resources, or both.

- **A Modern, Simple Interface** – Unisphere, Dell Unity's management interface has been built with the modern-day data center administrator in mind. Using browser-native HTML5, Unisphere can be used across various Operating Systems and web browsers without the need of additional plug-ins. The interface has been designed to mimic the practical flow of an administrator's daily life, organizing provisioning and management functions into easy-to-find categories and sections.

- **Flexible Deployment Options** – With Dell Unity, a deployment offering exists for a range of different use cases and budgets, from the virtual offering of Dell UnityVSA to the purpose-built Dell Unity platform. The purpose-built Dell Unity system can be configured as an All Flash system with only solid-state drives, or as a Hybrid system with a mix of solid state and spinning media to deliver the best on both performance and economics.

- **Inline Data Reduction** – Data reduction technologies play a critical role in environments in which storage administrators are attempting to do more with less. Dell Unity Data Reduction aids in this effort by attempting to reduce the amount of physical storage needed to save a dataset, which helps reduce the Total Cost of Ownership of a Dell Unity storage system. Dell Unity Data Reduction provides space savings by using data deduplication and compression. Data reduction is easy to manage, and once enabled, is intelligently controlled by the storage system.

- **Optional I/O Modules** – A diverse variety of connectivity is supported on the purpose-built Dell Unity platform. Also, I/O Modules that support iSCSI and NAS may be used for both simultaneously.

- **Expanded File System** – At its heart, the Dell Unity File System is a 64-bit based file system architecture that provides increased maximums to keep pace with the modern data center. Provision file systems and VMware NFS Datastores in sizes as large as 256TB, and enjoy creating multiple millions of files per directory and subdirectories per directory.

- **Native Data Protection** – Security and availability of data are critical concerns for many customers, and Dell Unity offers multiple solutions to address this need. Unified Snapshots provide point-in-time copies of block and file data that can be used for backup and restoration purposes. Asynchronous Replication offers an IP-based replication strategy within a system or between two systems. Synchronous Block Replication benefits FC environments that are close together and require a zero-data loss schema. Data at Rest Encryption ensures user data on the system is protected from physical theft and can stand in the place of drive disposal processes, such as shredding.

- **VMware Integration** – Discovery of a VMware environment has never been easier, with Dell Unity's VMware Aware Integration (VAI). Use VAI to retrieve the ESXi host and vCenter environment details into Unisphere for efficient management of your virtualization environment. Support for VMware vStorage APIs for Storage Awareness (VASA) and later enables the provisioning and use of VMware Virtual Volumes (vVols), a virtualization storage technology delivered by VMware's ESXi. Dell Unity supports vVols for both block and file configurations.

- **Multiple Management Paths** – Configure and manage your Dell Unity system in the way you are most comfortable. The Unisphere GUI is browser-based and provides a graphical view of your system and its resources. Use Unisphere CLI (UEMCLI) over SSH or over a Windows host to run CLI commands against the system. Dell Unity also has a full REST API library available. Any function possible in Unisphere is also possible using Dell Unity REST API. Developing scripts or integrating management of your Dell Unity system into existing frameworks has never been easier.

Hardware Overview

Dell Unity Family – Available Models

The purpose-built Dell Unity system is offered in multiple different physical hardware models in both Hybrid configurations and All-Flash configurations. For Hybrid systems, the platform starts with the Dell Unity 300, and scales up to the Dell Unity 880 while for All-Flash systems, the platform starts with the Dell Unity 300F and scales up to the Unity XT 880F. The models share several similarities in form factor and connectivity, but scale in processing and memory capabilities (See Table 1, Table 2, and Table 3).

For software-defined offerings, Dell Unity Family offers a virtual deployment of Dell Unity called Dell UnityVSA which can be installed on applicable VMware ESXi hosts. There is also the option of a dual-SP deployment of Dell UnityVSA called Dell UnityVSA HA which provides greater resiliency against disaster. Lastly, there is a cloud-specific deployment of Dell Unity called Dell Unity Cloud Edition that customers can leverage for file synchronization and disaster recovery operations in the cloud. More information about these available virtual deployments can be found in the sections Dell UnityVSA and Dell Unity Cloud Edition.

Additionally, the system limits will change depending on the Dell Unity model. More information about system limits can be found in the Dell Unity Simple Support Matrix on E-Lab Navigator.

Note that this white paper document focuses specifically on the Unity XT Series systems which include the Unity XT 380/F, 480/F, 680/F, and 880/F models. For more information about other Dell Unity models, see the white paper Dell Unity: Introduction to the Platform on the Dell Technologies Info Hub.

Drive Model Comparison

Multiple drive types are supported on the Dell Unity system. All Flash models support Flash drives, while Hybrid Dell Unity models support Flash, SAS, and NL-SAS drives. All drives operate at 12Gb/s speeds. SAS and NL-SAS drives utilize a 4KB drive formatting size, while Flash drives utilize a 520-byte block size. A list of all supported drives can be found on Dell Online Support.

Data-in-Place Conversions

Dell Unity OE Version 5.2 introduced the ability to perform both offline and online data-in-place (DIP) conversions which allows users to convert physical Unity XT 480/F and 680/F

systems to any higher model of the same type without losing any data or system configurations. Unity XT 380/F systems are exempt from DIP conversions because the Unity XT 380/F systems use a different physical chassis than the 480/F, 680/F, and 880/F models. The DIP process involves swapping the storage processors in a given system with new storage processors of a higher model while reusing the same I/O modules, SFPs, and power supplies from the replaced storage processors. For Unity XT system that use low-line power (100v-120v) and are being upgraded to an 880/F model, a step-up transformer is required since Unity XT 880/F systems only support high-line power (200v-240v). If installing a step-up transformer within a rack, the step-up transformer will require additional rack space.

This conversion process supports both offline and online procedures and is fully customer installable. The estimated time for a full data-in-place conversion is 150 minutes. For an online conversion, each storage processor is upgraded one at a time and data remains accessible during the procedure. For an offline conversion, data will be inaccessible during the procedure as the system is completely powered down and both storage processors are upgraded simultaneously. Typically, the offline conversion will complete faster as both storage processors upgrade simultaneously. Customers can choose online or offline conversion based on their preference. The target model must be the same type as the source model. For example, you can convert from a Unity XT 480 to Unity XT 880, but not from a Unity XT 480 to a Unity XT 880F system.

For more information about the Dell Unity and Unity XT model data-in-place conversions, see the technical guide titled *Dell Unity Family Data-in-Place Conversion Guide* on Dell Online Support.

I/O Module Conversions

Dell Unity OE version 5.2 introduced the ability to perform an online conversion of the 16Gb fibre channel I/O module to the 32Gb fibre channel I/O module. The 32Gb I/O module was introduced in Dell Unity OE version 5.1. The I/O module conversion feature allows customers to upgrade their existing 16Gb fibre channel I/O module and benefit from a 32Gb fibre channel environment while data remains online and accessible. The process involves replacing the existing I/O module one storage processor at a time with the new I/O module. The procedure is Command-Line Interface (CLI) driven using the **svc_change_hw_config** service script and it is recommended to use Dell Deployment Services to perform the upgrade on behalf of the customer. The upgrade procedure is supported for Unity XT systems, including the 380/F, 480/F, 680/F, and 880/F models.

Disk Processor Enclosure (DPE) – 380/F

Dell Unity's Disk Processor Enclosure (DPE) for Unity XT Series models utilize a 25-drive 2U DPE using 2.5" drives. Note, though, that the Unity XT 380/F uses a different physical chassis than the 480/F, 680/F, and 880/F models. The following figures and related information are specific to the 380/F model. For information about the DPE for the 480/F, 680/F, and 880/F models, see section 3.3 titled Disk Processor Enclosure (DPE) – 480/F, 680/F, 880/F.

Figure 2.   25-Drive 2U DPE (380/F)

For 380/F systems, on the front of the DPEs (see Figure 2) are LEDs for both the enclosure and drives to indicate status and faults. The first four drives of the DPE are known as system drives and contain copies of data used by the operating environment. While they can be used in Pools to hold user data, the entire formatted capacity of the system drives will not be available as some space is reserved for the system. These drives should not be moved within the DPE or relocated to another enclosure and should be replaced immediately in the event of a fault. A system drive cannot be used as a traditional pool hot spare for a non-system drive. For this reason, the minimum number of drives in a system is five with system drives configured in a RAID 1/0 (1+1 or 2+2) configuration including a non-system drive traditional pool hot spare.

The rear of the DPE reveals the Storage Processors (SP) and their on-board connectivity. Each Storage Processor has 2x 12Gb SAS ports, used for connecting additional storage and each SAS port has a 4-lane configuration. For front-end connectivity, the SPs have 2x 10GbE BaseT ports which can auto-negotiate between 10Gb/1Gb/100Mb, and 2x Converged Network Adapter (CNA) ports. These CNA ports can be configured to serve 16Gb/8Gb/4Gb Fibre Channel using either multi-mode or single mode FC SFPs, 10GbE Optical using SFP+ connectors or TwinAx cables in active or passive mode, or 1GbE BaseT using RJ45 SFPs. For optical connections, the CNAs feature full iSCSI offload which relieves the Storage Processor from handling TCP/IP network stack operations. For management and service, each SP has a dedicated 1GbE BaseT management port and a dedicated 1GbE BaseT service port; both ports operate at 1Gb/100Mb/10Mb speeds. In Dell Unity OE version 5.1, management port settings can be customized to match the environment by manually changing MTU, port speed and/or duplex settings. The range of these settings include MTU of 1280-9000, port speeds of 1Gbps, 100Mbps, or 10Mbps, and advertised duplex of full, half, or auto. These settings can be changed using **svc_network** service command.

The DPE on 380/F systems is internally connected to Bus 0 which is the same bus that the first SAS expansion port is connected to. Therefore, the DPE is recognized by the system as "Bus 0 Enclosure 0" while the first DAE connected to the first SAS expansion port would be "Bus 0 Enclosure 1". Furthermore, this means that the twenty-five drives in front of the DPE are internally recognized as "Bus 0 Enclosure 0 Drive 0" – "Bus 0 Enclosure 0 Drive 24".

For a detailed description of the hardware on Unity XT 380/F systems, see the *Unity XT Hardware Information Guide* on Dell Online Support.

Figure 3.   Rear of DPE (380/F)

Unity XT 380 and Unity XT 380F Storage Processors manufactured in the second half of 2022 and later have been redesigned and no longer include 10GbE BaseT embedded ports. For the 380 models, this removes 2x 10GbE BaseT ports per SP or 4x total per system. 10GbE BaseT front-end connectivity is still supported by using the 4-port 10GbE I/O module described in the section I/O Module Options – 380/F, 480/F, 680/F, 880/F of this document. Unisphere can be used to confirm if the 10GbE BaseT embedded ports are present on a system. In Unisphere, navigate to SYSTEM > System View > Enclosures > Rear and review the ports on the DPE.

Storage Processor – 380/F

The Unity XT 380/F system is powered by an Intel® Xeon® Processor utilizing Intel's Broadwell architecture, with six cores per Storage Processor. Each purpose-built system contains two Storage Processors (SPs), which are used for high availability and load balancing purposes.

M.2 SSD – 380/F

An M.2 SSD device is located inside each Storage Processor and serves as a backup device in the event of an SP failure (Figure 4). In the event of an SP failure, the memory contents of the SP's cache are written to the M.2 SSD device so it can be recovered once the SP is restored. If the M.2 SSD device itself encounters a failure, cache data can be recovered from the peer Storage Processor. The M.2 SSD device also holds the boot image that is used to run the operating environment.

Figure 4.   M.2 SSD Device (380/F)

Cooling Modules – 380/F

Cooling modules or fan packs (Figure 5) are used to provide cool airflow to the Storage Processor's interior. There are five counter-rotating cooling modules in a Storage Processor for 380/F systems. A Storage Processor can tolerate a single cooling module fault; in which case the surviving fans will increase their speed to compensate for the faulted module. If a second cooling module faults, the Storage Processor will gracefully save cache content and shut down to prevent overheating.
Figure 5.   Cooling Module (380/F)

Battery Backup Unit (BBU) – 380/F

The Battery Backup Unit (BBU) provides power to the Storage Processor if cabinet power is lost. The BBU (Figure 6) is designed to power the SP long enough for the system to store SP write cache content to the M.2 SSD device before powering down. The BBU includes sensors which communicate its charge and health status to the SP. In the event the BBU is discharged, the SP will disable write cache until the BBU has recharged. In the event the BBU has faulted or cannot sustain enough charge, an alert will be generated.

Figure 6.   Battery Backup Unit (380/F)

Baffle – 380/F

The baffle (Figure 7) directs airflow within the Storage Processor. Cool air drawn in from the cooling modules is directed to the processor and DIMMs for effective thermal management.
Figure 7.   Baffle (380/F)

Dual-Inline Memory Module (DIMM) – 380/F

There are four Dual-Inline Memory Module (DIMM) slots on a Storage Processor for a 380/F system. These are filled with up with four 16GB DIMMs. An example DIMM is represented in Figure 8. DIMMs use error-correcting code (ECC) to protect against data corruption. If a DIMM is faulted, the system will boot into Service Mode so the faulted DIMM can be replaced.

Figure 8.   Dual-Inline Memory Module (DIMM) (380/F)

Power Supply – 380/F

There are two power supply modules in a Disk Processor Enclosure (DPE), one per Storage Processor. A single power supply is capable of powering the entire DPE. Power supplies can be replaced without having to remove the Storage Processor or shutdown the system. Power supplies are offered for AC power and in Dell Unity OE version 5.2, a NEBS compliant DC variant power supply was introduced for Dell Unity XT 380/F and 480/F models. DC power supplies are not available for the 680/F and 880/F. For Unity XT 380 and 480 DC powered systems, 600GB and 1.8TB 10k SAS NEBS certified as well as 800GB 3WPD SSD NEBS certified drives are available. For Unity XT 380F and 480F DC powered systems, 1.92TB and 3.84TB 1WPD SSD NEBS drives are available.

For more information about Dell Unity DC-powered systems, see the technical paper called *Dell Unity DC-Powered Enclosures Installation & Operation Guide.*

Figure 9.   Power Supply (380/F)

Disk Processor Enclosure (DPE) – 480/F, 680/F, 880/F

Dell Unity's Disk Processor Enclosure (DPE) for Unity XT Series models use a 25-drive 2U DPE using 2.5" drives. Note, though, that the Unity XT 480/F, 680/F, and 880/F models use a different physical chassis than the 380/F. The following figures and related information are specific to 480/F, 680/F, and 880/F models. For information about the DPE for the 380/F model, see the section Disk Processor Enclosure (DPE) – 380/F.

Figure 10.   25-Drive 2U DPE (480/F, 680/F, 880/F)

For 480/F, 680/F, and 880/F systems, on the front of the DPEs (see Figure 10) are LEDs for both the enclosure and drives to indicate status and faults. The first four drives of the DPE are known as system drives, and contain data used by the operating environment. While they can be used in Pools to hold user data, the entire formatted capacity of the system drives will not be available as some space is reserved for the system. These drives should not be moved within the DPE or relocated to another enclosure and should be replaced immediately in the event of a fault. A system drive cannot be used as a traditional pool hot spare for a non-system drive. For this reason, the minimum number of drives in a system is 5 with system drives configured in a RAID 1/0 (1+1 or 2+2) configuration including a non-system drive traditional pool hot spare.

The rear of the DPE reveals the Storage Processors (SP) and their connectivity options (see Figure 11). Each SP has 1x 1GbE management port, 1x 1GbE service port, 1x 4-port mezzanine card (optional), 2x I/O module slots (optional), and 2x 12Gb SAS ports, used for connecting additional storage and each SAS port has a 4-lane configuration. For management and service, each SP has a dedicated 1GbE BaseT management port and a dedicated 1GbE BaseT service port; both ports can operate at 1Gb/100Mb/10Mb speeds. In Dell Unity OE version 5.1, management port settings can be customized to match the environment by manually changing MTU, port speed and/or duplex settings. The range of these settings include MTU of 1280 through 9000, port speeds of 1Gbps, 100Mbps, or 10Mbps, and advertised duplex of full, half, or auto. These settings can be changed using **svc_network** service command. For front-end connectivity, the SPs have the option of a 4-port mezzanine card which have the option of being a 4-port 25GbE Optical, 4-port

10GbE BaseT, or blank filler based on how the system is ordered. For the 4-port 25GbE Optical option, the port speed is based on the SFP installed in each of the ports. You can mix the types of SFPs on the same card as needed. For the 4-port 10GbE option, the ports can auto-negotiate between 10Gb/1Gb/100Mb speeds as needed. The 4-port card slots can be populated at a later point in time if the system is ordered with blank fillers for those slots.

The DPE on 480/F, 680/F, and 880/F systems is internally connected to Bus 99 which is the separate bus than the first SAS expansion port is connected to which is Bus 0. Therefore, the DPE is recognized by the system as "Bus 99 Enclosure 0" while the first DAE connected to the first SAS expansion port would be "Bus 0 Enclosure 0". This is different than X00/F, X50F, and 380/F systems. Furthermore, this means that the twenty-five drives in front of the DPE for 480/F, 680/F, and 880/F systems are internally recognized as "Bus 99 Enclosure 0 Drive 0" – "Bus 99 Enclosure 0 Drive 24". Although in Unisphere, the drives are seen "DPE Drive 0" – "DPE Drive 24".

For a detailed description of hardware for 480/F, 680/F, and 880/F systems, see the Unity XT Hardware Information Guide on Dell Online Support.

Figure 11.   Rear of DPE (480/F, 680/F, 880/F)

Storage Processor – 480/F, 680/F, 880/F

The purpose-built Unity XT platform for 480/F, 680/F, and 880/F systems are powered by an Intel® Xeon® Processor utilizing Intel's Skylake architecture, depending on the system model and the core count will vary between 8 to 18 cores per CPU with two CPUs per Storage Processor. Each purpose-built system contains two Storage Processors (SP), which are used for high availability and load balancing purposes.

M.2 SSD – 480/F, 680/F, 880/F

There are two M.2 SSD devices, one connected using SATA protocol and one connected using NVMe protocol, located inside each Storage Processor for 480/F, 680/F, and 880/F systems. The devices serve two separate purposes; one as a backup device in the event of an SP failure (Figure 12) and one as a boot device for the system operating environment (Figure 13). In the event of an SP failure, the memory contents of the SP's cache are written to the M.2 NVMe SSD device so the data can be recovered once the SP is restored. If the M.2 NVMe SSD device itself encounters a failure, cache data can be recovered from the peer Storage Processor. The M.2 SATA SSD device holds the boot image that is used to boot the operating environment.

Cooling Modules – 480/F, 680/F, 880/F

Cooling modules or fan packs are used to provide cool airflow to the Storage Processor's interior. There are six counter-rotating cooling modules in a Storage Processor for 480/F, 680/F, and 880/F systems. A Storage Processor can tolerate a single cooling module fault; the surviving fans will increase their speed to compensate for the faulted module. If a second cooling module faults, the Storage Processor will gracefully save write cache content and shut down.

Figure 14. Cooling Module (480/F, 680/F, 880/F)

Battery Backup Unit (BBU) – 480/F, 680/F, 880/F

The Battery Backup Unit (BBU) provides power to the Storage Processor if cabinet power is lost. The BBU is designed to power the SP long enough for the system to store SP cache content to the M.2 SSD devices before powering down. The BBU includes sensors which communicate its charge and health status to the SP. In the event the BBU is discharged, the SP will disable cache until the BBU has recharged. In the event the BBU has faulted or cannot sustain enough charge, an alert will be generated.

Figure 15. Battery Backup Unit (480/F, 680/F, 880/F)

Baffle – 480/F, 680/F, 880/F

The baffle directs airflow within the Storage Processor. Cool air drawn in from the cooling modules is directed to the processor and DIMMs for effective thermal management.

Figure 16. Baffle (480/F, 680/F, 880/F)

Dual-Inline Memory Module (DIMM) – 480/F, 680/F, 880/F

There are twenty-four Dual-Inline Memory Module (DIMM) slots on a Storage Processor. These are filled with up to 12 DIMMs depending on model. An example DIMM is represented in Figure 17. DIMMs are between 16 and 32GB in size and use error-correcting code (ECC) to protect against data corruption. If a DIMM is faulted, the system will boot into Service Mode so the faulted DIMM can be replaced.

Figure 17. Dual-Inline Memory Module (DIMM) (480/F, 680/F, 880/F)

Power Supply – 480/F, 680/F, 880/F

There are two power supply modules in a Disk Processor Enclosure (DPE). A single power supply is capable of powering the entire DPE. Power supplies can be replaced without having to remove the Storage Processor. Power supplies are offered for AC power only.

Dell Unity OE version 5.2 introduced DC variant power supplies for Dell Unity XT 380/F and 480/F models which are NEBS compliant. DC power supplies are not available for the 680/F and 880/F. For Unity XT 380 and 480 DC powered systems, 600GB and 1.8TB 10k SAS NEBS drives as well as 800GB 3WPD SSD NEBS certified drives are available. For Unity XT 380F and 480F DC powered systems, 1.92TB and 3.84TB 1WPD SSD NEBS drives are available.

For more information about Dell Unity DC-powered systems, see the technical paper called *Dell Unity DC-Powered Enclosures Installation & Operation Guide*.

I/O Module Options – 380/F, 480/F, 680/F, 880/F

Each Storage Processor on Unity XT systems can support up to two I/O modules. I/O modules provide additional connectivity. For the two Storage Processors in a DPE, the I/O Modules configured must match between SPs. Note that Fibre Channel over Ethernet (FCoE) and Fibre Channel over IP (FCIP) are not supported on the Dell Unity platform.

The Unity XT Series systems support the following I/O modules:

- 12Gb SAS (Unity XT 480/F, 680/F, 880/F only)

- 25GbE Optical (4-Port)

- 16Gb Fibre Channel (4-Port)

- 10GbE BaseT (4-Port)

- 32Gb Fibre Channel (4-port)

The 12Gb SAS (4-Port) I/O module is used to provide additional backend connectivity to Disk Array Enclosures. Each SAS port supports up to 10 DAEs and up to a maximum of 250 drives. This module is required when utilizing high-bandwidth x8 SAS lane connections for the 80-drive DAE.

Figure 19.   12Gb SAS I/O Module

The 16Gb Fibre Channel (4-Port) I/O module offers frontend connectivity at 16Gbps speeds and can auto-negotiate to 8Gbps and 4Gbps speeds depending on the SFPs installed. There are ordering options for single-mode SFPs and multi-mode SFPs configurations depending on the use case in a datacenter environment. Single-mode SFPs only operate at 16Gb speeds and are not compatible with multi-mode connections. Single-mode connections are usually used for long distance synchronous replication use cases to remote sites while multi-mode is typically used for transmitting data over shorter distances in local-area SAN networks and connections within buildings. For upgrading a 16Gb Fibre Channel I/O module to a 32Gb Fibre Channel I/O module, see the section I/O Module Conversions for more information.
Figure 20.   16Gb Fibre Channel I/O Module

The 10GbE BaseT (4-Port) I/O module operates at up to 10Gb/s speeds and is used for frontend host access and supports both iSCSI and NAS protocols. The I/O module can

also auto-negotiate to 1Gbps and 100Mbps speeds as needed. The ports on an individual Ethernet I/O module, and the on-board Ethernet ports or Mezz card Ethernet ports support link aggregation, fail safe networking (FSN), and VLAN tagging. Link aggregation can be configured across all available Ethernet ports as needed.

Figure 21.   10GbE BaseT I/O Module

The 25GbE Optical I/O module runs at a fixed speed of 25Gbps given it is using 25Gb SFPs. The I/O module also supports 10Gb SFPs to run at 10Gbps speeds. The Optical I/O module ports support SFP+ and TwinAx (active or passive mode) connections. Note that different SFPs and/or TwinAx cables can be mixed on the same I/O module and are hot swappable.

Figure 22.   25GbE Optical I/O Module

The 32Gb Fibre Channel (4-port) I/O module provides frontend host connectivity for speeds up to 32Gbps with various different SFPs. The 32Gb multi-mode SFP is capable of auto-negotiating to 32Gbps, 16Gbps, and 8Gbps. Meanwhile, the 16Gb multi-mode SFP is capable of auto-negotiating to 16Gbps, 8Gbps, and 4Gbps speeds. A single-mode SFP is also supported which operates only at 16Gbps and is generally used for long distance synchronous replication use cases. The 32Gb I/O module can have different SFP types per port. For example, port 0 could have a 32Gbps SFP while ports 1-3 could have a 16Gbps SFP so long as the SAN supports both speeds. When using multiple SFP types, it is recommended to ensure the peer storage processor has the same SFPs inserted into each port.

Disk Array Enclosure (DAE) Options – 380/F, 480/F, 680/F, 880/F

The purpose-built Unity XT Series systems have three different DAE configuration options:

- 25-Drive 2U DAE using 2.5" drives
- 15-Drive 3U DAE using 3.5" drives

25-Drive, 2.5" 2U DAE

The 25-drive, 2.5" 2U DAE holds up to twenty-five 2.5" drives (Figure 24). The back of the DAE includes LEDs to indicate power and fault status. There are also LEDs to indicate bus and enclosure IDs.

The 80-drive 2.5" 3U DAE is available for Unity XT Hybrid and All Flash systems and can be powered using AC power and is attached to the DPE by mini-SAS HD connectors (Figure 28). A high-bandwidth x8 lane SAS connectivity option to the DPE is also available for models that support the 4-port 12Gb SAS I/O module which include the Unity XT 480/F, 680/F, and 880/F. For supported drive types/sizes on the 80-drive DAE, see the *Dell Unity Drive Support Matrix* on Dell Online Support.

In terms of operating power, the 80-drive DAE operates from 200 to 240V AC at 47 to 63 Hz with a max power consumption of 1,611 VA (1,564 W). For a full listing of power requirements and related hardware information, see the *Unity XT Hardware Information Guide* on Dell Online Support.

Dell UnityVSA

Dell Unity is offered in a Virtual Storage Appliance version known as Dell UnityVSA. Dell UnityVSA is a Software Defined Storage (SDS) solution that runs atop the VMware ESXi Server platform. Dell UnityVSA provides a flexible storage option for environments that do not require purpose-built storage hardware such as test/development or remote office/branch office (ROBO) environments. Users can quickly provision a Dell UnityVSA on general purpose server hardware, which can result in reduced infrastructure costs and a quicker rate of deployment.

In Dell Unity OE version 4.5, a High Availability (HA) version of the Dell UnityVSA was introduced, also known as Dell UnityVSA Dual-SP. Dell UnityVSA Dual-SP is an enhanced version of the single-SP Dell UnityVSA solution. This is accomplished by adding HA functionality whereby Dell UnityVSA Dual-SP can recover from an SP or host failure which significantly increases the system's applicable use case scenarios and enables non-disruptive upgrades (NDU). Dell UnityVSA Dual-SP is only available with Professional Edition (PE) licenses. In OE version 5.1, Professional Edition licenses come in capacity choices of 10TB, 25TB, 50TB, or 350TB options. Additionally, the Dell UnityVSA Dual-SP can be deployed as a 2-core CPU / 12GB memory per-SP or a 12-core CPU / 96GB memory per-SP system.

Overview

Dell UnityVSA retains the ease-of-use and ease-of-management found in the purpose-built Dell Unity product. Its feature set and data services are designed to be on par with the rest of the Dell Unity family. There are some main differences in functionality support, which stem from the virtual nature of the Dell UnityVSA deployment.

Dell UnityVSA Hardware Requirements

Dell UnityVSA can run on any server that supports VMware ESXi and meets minimum hardware requirements. If local storage is used, a hardware RAID controller on the ESXi server is recommended to be used to configure redundant storage for Dell UnityVSA. If storage is being provided from a redundant storage system or server SAN, a RAID controller on the ESXi server is not required. A full description of the minimum server requirements for a single Dell UnityVSA instance is detailed in Table 4.

Table 4.   Dell UnityVSA Single-SP Server and VM Requirements

	Minimum requirement	Recommended requirement

Dell UnityVSA HA has similar physical requirements as Dell UnityVSA Single-SP on a per SP basis. In terms of VMware requirements, a vCenter is mandatory in addition to the configuration of internal networks. To comply with best practices, Dell UnityVSA HA requires a separate ESXi host for each SP that is deployed. The white paper titled Dell UnityVSA provides further detail on the best practices and the exact VMware requirements. A full description of recommended server requirements for both the 2-core and 12-core CPU deployments of the Dell UnityVSA HA are outlined below.

Dell Unity Cloud Edition

As customers select a cloud-operating model to support their applications, elasticity and scalability of public clouds and enterprise file capabilities such as tiering, quotas, and snapshots are top requirements. Customers are looking to leverage the cloud for file synchronization and disaster recovery operations.

Dell Unity Cloud Edition addresses these requirements with support for VMC (VMware Cloud) on AWS (Amazon Web Services). Dell Unity Cloud Edition can be easily deployed in a VMware Cloud SDDC (Software-Defined Data Center) to provide native file services such as NFS and SMB. Dell Unity Cloud Edition also enables disaster recover between on premise deployed Dell Unity systems and VMware Cloud-based appliances.

Dell Unity Cloud Edition is a virtualized storage appliance that has a rich feature set, comparable to the rest of the Dell Unity Family. Because of its ease of use and quick deployment time, this makes Dell Unity Cloud Edition the ideal candidate for test/dev environments or production deployments into VMC on AWS.

Dell Unity Cloud Edition supports the same deployment options as Dell UnityVSA. In OE version 5.1 this includes the increased capacity limit of up to 350TB and the 2-core / 12GB memory and 12-core / 96GB memory Dual-SP deployment options.

For more information about Dell Unity Cloud Edition and its benefits, see the paper titled *Dell Unity Cloud Edition with VMware Cloud on AWS* on the Dell Technologies Info Hub.
