Dell Technologies security expertise combined with cutting-edge vulnerability scanning and prioritization technology

Over 50% of organizations have experienced a data breach caused by a third party, with 44% of these breaches occurring in the last 12 months.¹ Meanwhile, the number of published vulnerabilities continues to expand – almost 22,000 new vulnerabilities were published in 2021.² As the number of vulnerabilities continues to increase, it’s nearly impossible for most organizations to address them all or to determine which ones present the biggest and most immediate threats. IT organizations need a way to identify the vulnerabilities in their environments and prioritize which vulnerabilities to remediate first.

**Vulnerability Management**

With Dell Vulnerability Management, Dell experts use leading technology to scan your IT environment at periodic intervals, providing a full view of vulnerabilities across your endpoints, network infrastructure and cloud assets. A report outlines each vulnerability and assigns a priority ranking of low, medium, high or critical. Dell experts use machine learning to pinpoint vulnerabilities that are actively being exploited in the wild and are more likely to be targeted in the near future. This helps you prioritize patching efforts on your most high-risk vulnerabilities and critical assets.

The Dell team provides quarterly reviews, information on vulnerability trends and guidance on scheduling patching activities. Working with Dell, your organization will experience an exceptional improvement in overall security posture.
