Only 40% of organizations have a well-defined ransomware incident response strategy that has been thoroughly tested.

It is crucial for businesses to have an incident response plan in place for dealing with ransomware in order to minimize risk. Practice is key in ensuring that all components (processes, technologies, and people) work together effectively. However, some organizations still have not tested their strategy, leaving them vulnerable to the devastating effects of ransomware. IT leaders should take the time to review and revise their incident response plans to ensure preparedness.
