Why Dell Technologies Multi-Cloud Data Protection
Why Multi-Cloud

Multi-Cloud is the Future

As organizations embark on their cloud journey, many are realizing only a multi-cloud deployment model can provide the security, performance, and flexibility necessary to host their diverse workload portfolio.

A multi-cloud operating model offers scale, performance, and operational efficiencies, and a multi-cloud approach adds flexibility to these benefits.

But...

This multi-cloud world introduces new challenges while trying to protect data, particularly when doing so with multiple vendor solutions.

Clearly, organizations require solutions that can protect their data regardless of where it is hosted and provide a consistent experience across environments. Furthermore, data protection must be capable of consuming services across both the private and public portions of their cloud, giving them the flexibility they need to meet recovery service level agreements (SLAs) should data become lost or unavailable.

Why Cloud Data Protection is a Mandate

Data Protection in the Cloud

- Ensures business continuity — keep applications running and ensure data is available
- Scalability to keep up with rapid data growth
- Deploy and protect new, cloud-native applications with confidence

Just because data is being redistributed and extended to the cloud does not mean protection of that data has become any less critical. In fact, it has become more so.

Remember: The responsibility to secure and protect all data assets in the cloud remains the responsibility of the customer.

Say the decision to use public cloud when deploying new business applications is driven by more reliable data protection¹

¹ Vanson Bourne was commissioned by Dell Technologies to survey 1,000 IT decision makers across 15 countries globally on their data protection strategies, their approaches to data protection in cloud environments, and the relative preparedness of their businesses in cases of disruption. https://www.datadoghq.com/container-report/
Why Dell Technologies
Data Protection

When it comes to multi-cloud data protection, Dell Technologies has you covered.

**Proven + Modern Portfolio**

Dell Technologies is a proven leader in data protection and has been for over a decade. Dell Technologies Data Protection software and hardware has consistently been recognized as the top performer in the purpose-built backup appliance and software storage segments by thought leaders such as IDC and ESG. We have taken that pedigree — boasting over 2900 active and pending data protection patents⁴ — and applied it to modern, **highly optimized cloud** environments.

WHY: Cloud Disaster Recovery

Building a complete and efficient disaster recovery plan is critical in an uncertain world, but disruptive events are on the rise. Most organizations will navigate at least one disruptive event during the course of a year.

Cloud storage provides scalable, highly available and easy to manage backup and recovery targets, and when integrated as part of a well planned and designed disaster recovery plan, can minimize the effects of disruptive events, from human error to catastrophic events.

82% have suffered from a disruptive event (e.g. downtime or data loss) in the last 12 months, compared to 76% in 2018.

How: Dell EMC Cloud DR

**Cost-Effective Disaster Recovery**
- Minimal cloud compute running 24/7 for minimizing cost
- Direct protection from PowerProtect DD on-premises to the cloud
- Recover to native cloud instances, VMware Cloud on AWS/Azure or directly back to on-premises vCenter

**Simple Deployment and Management**
- Leverage what you know and own, including Dell EMC, VMware, AWS, Azure, AWS GovCloud

**Simplified, Fully Orchestrated DR**
- Quickly and easily test DR to ensure data validity, then promote to Failover
- Orchestrated failover of workloads to AWS, AWS GovCloud, Azure in case of disaster
- In case of a data loss event, 3 click failover, 2 click failback
"Our students spend countless hours creating animations and images, so it’s critical to protect this data and make it available at any time." — Victor Jabrassian, Chief Information Officer, Sci-ARC
WHY: Long Term Retention

Most organizations follow corporate or regulatory compliance requirements that govern how long data must be kept — not only is it legally required in many areas, it is also just good data governance. Traditionally, long term, infrequently accessed data would be the realm of tape. But archiving to tape is a costly and cumbersome process, and tape storage and retrieval introduces risk to the data recovery process. With the rise of low cost cloud storage technologies, it no longer makes sense to use tape for long term retention.

PowerProtect DD Cloud Tier can accelerate your migration away from tape and modernize your long-term retention by using cloud storage.
